5	3. Scope of Work 3.3 (iv) page 8	Crop-to-Residue Ratios (CRR) for different Biomass fuels and for Bagasse should also be validated with reported documents and also using direct measurement methods.	Major biomass is grown in two season and direct measurement method for estimation of CRR will require to be estimated at harvesting stage of the respective crop. Since, the period for the study is indicated as 4 months, it will not possible to estimated CRR for different type of biomass using direct measurement method.	CRR for different Biomass fuels and for Bagasse should also be validated with reported documents. Further, study period has been increased which will enable estimation of CRR by direct measurement method. Analysis based on these data (secondary and direct measurement) shall be used for arriving conclusions.
6	3. Scope of Work 3.3 (ix) page 9	To determine residual value of the Bagasse based fuel after considering price of procuring sugarcane and income earned through processing of such sugarcanes in the plants.	Not clear	Residual value of Bagasse (fuel Cost) = Procurement cost of sugarcane - Income earned from that sugarcane by processing in the plant for manufacturing sugar and other byproducts, if applicable.
7	5. Timeline	Timeframe of 6 months from the date of work order, with 4 months for completion of all data collection and data analysis and 2 months for finalization of the report and recommendations.	Considering the volume of work, needs to cover 18 biomass plants and 142 sugar factories spread over in 24 districts scattered over the state and crop residues ratio to be evaluated by direct measurement method and in addition to data to be collected from 5 other states will require more time, may be at least 8 months.	Revised time line is specified in the Corrigendum No-2 issued by the Commission.
